

ABSTRACT OF THE DISCLOSURE

Supply system (10) for the delivery of elements (130, 150) to one or more users (12) comprising a forwarding device (76, 76', 76'') which supplies the elements from a stored quantity (78) to a sorting device (70, 70'), which only permits elements having a predetermined position to pass and with a transport device (72, 72'), which transports the positionally correctly sorted elements (130, 150) to the user (12), characterized in that the forwarding device (76, 76', 76'') forms part of a basic module while the sorting device (70, 70') and the transport device (72, 72') belong to an interchangeable module. In this way the components of the supply system (10) can be manufactured and used more rationally, whereby the investment costs sink and can be more quickly amortized.
